Attachment Device

By implementing a tool-securing system, you prevent tools from becoming the next dropped object when working at heights.

We have developed a tool-securing system with a controlled attachment device. The system is tested in the presence of Danish Technological Institute and manufactured according to a documented production-control system, involving a product certificate.

The attachment device consists of a flexible stainless-steel wire that is closed with a copper talurit and protective colour coded tubing. An identification tag ensures full traceability to wire batch, production date and manufacturer. A QR code links to the relevant information on our website.

What we provide

You may purchase your tools complete with attachment devices from Fanø Kran-Service. Alternatively, our competent service technicians can provide your existing tools with attachment devices, either at our workshop in Esbjerg or on site worldwide.

Finally, you may become trained and certified in the complete setup for the tool-securing system, including product testing of the attachment devices, that will thus be covered by the Fanø Kran-Service product certificate. We will provide you with any necessary tools and materials to allow you to secure your own hand tools in accordance with best practice.

Colour Coding

Colour coding of the system will help you identify the lanyards to be used together with your hand tools e.g.:

RED protective tubing - **RED** name tag for tool lighter than 2 kg

BLACK protective tubing - **BLACK** name tag for tool heavier than 2 kg

Please contact us for further details and specifications.
